chlorination.

Domestic water supplies in Wasatch County are obtained almost entirely from springs, seeps or wells, and the quality appears to be very good, except for the fact that some of it is hard.

Experience seems to indicate that urban development thru out the valley would increase governmental costs substantially. The scatterings of dwellings and other urban uses indiscriminately over the entire valley, while using individual septic tanks to dispose of domestic sewage will likely pollute the underground water and thereby necessitate constructing and maintaining a very expensive valley-wide water distribution system and sewage collection system long before there are enough houses to make such a project economically feasible.

When a new highway goes into use, it already is paid for. Road-use taxes, collected in trust funds, finance Utah's highway system on a pay-as-you-go basis, and those who benefit pay the bill.
